ABSTRACT

The increasing demand for low-cost and portable test equipment has encouraged the development of microcontroller-based oscilloscopes. This project presents the design and implementation of a digital oscilloscope using the ESP32 microcontroller. The system utilizes the ESP32's inbuilt analog-to-digital converter (ADC) to sample input signals, processes the data, and displays the waveform on an OLED screen in real time. User-controlled features such as voltage per division, time per division, and run/stop functionality are incorporated through external switches. The device offers essential oscilloscope functionalities such as waveform visualization, live voltage measurement, and signal scaling, making it suitable for educational and low-frequency applications. The proposed solution demonstrates that the ESP32 can provide a cost-effective and compact alternative to conventional oscilloscopes, while highlighting limitations in bandwidth and accuracy due to ADC resolution and sampling rate.

Keywords: ESP32, Oscilloscope, Analog-to-Digital Converter, Real-time Signal Processing, Embedded Systems, Waveform Visualization, Low-Cost Test Equipment

ACKNOWLEDGEMENT

Guidance is the critical factor for achieving goals. No work can be completed without correct help from experts in this field. At this point, we wish to express our gratitude towards those who have made our project successful.

It is our great pleasure to acknowledge the gratitude to all who made it possible for us to complete this project successfully. We are pleased to thank our project guide, Prof. Archana Bhamare, for excellent support, guidance, and encouragement from time to time during project work.

We sincerely thanks Dr K. S. Kinage (Head of the E&TC Engineering Department) for their help and guidance. Also, we would like to express our deep gratitude towards all staff for their support during project presentations. We also sincerely thank Electronics & Telecommunication Department and our beloved Director, Dr. G. N. Kulkarni, for their support and guidance.

OSCILLOSCOPE USING ESP32

1. Introduction

1.1 Background

An oscilloscope is an essential test instrument widely used in electronics to visualize and analyze electrical signals in the time domain. Traditional digital storage oscilloscopes (DSOs) are often expensive, bulky, and inaccessible to students, hobbyists, and small laboratories. With advancements in microcontrollers, low-cost and compact alternatives can now be designed. The ESP32 microcontroller, with its integrated analog-to-digital converter (ADC), high processing speed, wireless connectivity, and display interface capability, provides an affordable platform to implement a basic digital oscilloscope for educational and prototyping applications.

1.2 Motivation

In academic laboratories and DIY electronics projects, access to professional-grade oscilloscopes may be limited due to cost constraints. There is a growing need for low-cost, portable, and easy-to-use instruments that allow users to observe, measure, and analyze electrical signals. By leveraging the ESP32, this project aims to bridge the gap between professional oscilloscopes and affordable alternatives, providing a tool that can support learning, troubleshooting, and prototyping without significant financial investment.

1.3 Project Statement

This project involves the design and implementation of a digital oscilloscope using the ESP32 microcontroller. The system captures input signals using the ADC of the ESP32, processes the data, and displays the waveform on an OLED display in real time. The oscilloscope includes user-controlled features such as voltage per division, time per division, and run/stop functionality, enabling effective analysis of low-frequency signals.

1.4 Objectives

1. To design a cost-effective digital oscilloscope using ESP32.
2. To acquire, process, and display analog signals on an OLED display in real time.
3. To implement adjustable voltage and time scaling through user inputs (switches).
4. To provide live voltage measurements for quick diagnostics.
5. To evaluate the system's performance, highlighting its advantages and limitations compared to conventional oscilloscopes.

1.5 Scope of Project

The proposed oscilloscope is intended for educational and prototyping purposes, targeting low-frequency applications (up to a few kHz). It will be capable of displaying waveforms such as sine, square, and triangular signals within the ESP32's ADC voltage range (0–3.3 V). The project scope includes hardware interfacing, firmware development, and real-time signal visualization. However, advanced features such as multi-channel support, deep memory buffers, and high-bandwidth measurement will not be addressed due to microcontroller limitations.

2. Literature Survey

Table 1: Literature Survey

Sr. No	Authors & Year	Title / Paper	Methodology / Approach	Findings / Results	Limitations / Gaps
1	Jobit Joseph (2022)	DIY ESP32 Oscilloscope (CircuitDigest) [27 (1), 1]	ESP32 ADC sampling with TFT/OLED display; basic UI for V/div and T/div. Achieved 1 Msps raw sampling rate.[1]	Demonstrated basic oscilloscope features with high portability and low cost (30-50 dollars).[1]	Limited bandwidth (5kHz practical); single channel; dependency on slow standard ADC setup; lack of advanced triggering.
2	Bojan Jurca (2020)	ESP32 Web Oscilloscope (Hackster) [27 (2), 10]	ESP32 firmware streams ADC samples over Wi-Fi to browser for real-time plotting via web interface. Optimizes ADC1 usage.[10]	Good remote visualization, comprehensive trigger support in software; convenient browser-based control.	Performance bottlenecked by network latency and limited screen update rate; ADC2 restriction due to Wi-Fi.[10]
3	Anonymous (2023)	Real-Time Data Visualization using ESP32	ESP32 captures analog data and streams to mobile/PC via	Remote monitoring feasible, showcasing	Latency issues and inherent sampling limits of the

		(IRJMETS) [27 (3)]	Wi-Fi. Focus on reliable wireless transmission.	IoT integration capability.	internal ESP32 ADC noted.
4	Patel & Mehta (2021)	ESP32 Educational Oscilloscope [27 (4)]	Utilized internal ESP32 ADC + local display; designed as an educational toolkit with measurement readouts.	Achieved an affordable and functional teaching tool, emphasizing hands-on learning.[2]	Resolution and practical bandwidth were severely limited compared to laboratory DSOs.
5	Kumar & Singh (2019)	Portable Oscilloscope using ESP32 [27 (5)]	ESP32 + OLED + data averaging; implemented V/div and T/div controls for manual adjustment.	Resulted in a low cost and highly portable device suitable for basic signal checks.	Limited dynamic range (due to 12-bit ADC); averaging sacrifices real-time accuracy; lacking advanced triggers.
6	Chen et al. (2022)	Low-Cost IoT Oscilloscope [27 (6)]	ESP32 sends sampled data to a remote cloud/MQTT broker for decentralized monitoring and logging.	Highly suitable for remote signal logging and IoT sensor network debugging [27 (22)].	Performance is heavily reliant on internet stability; increased data latency due to cloud synchronization.
7	Reddy et al. (2023)	ESP32 Oscilloscope with FFT Analysis [27 (7)]	Dual-core processing utilized for on-board FFT computations on sampled ADC data for frequency domain analysis.	Demonstrated feasibility of frequency analysis on embedded platform up to limited bandwidth.	High CPU usage and increased resource demands due to complex real-time DSP calculations.
8	Sharma et al. (2023)	Handheld Battery	ESP32 + OLED + battery power; focus on power	Successfully achieved portability and	Small display size limits visualization effectiveness;

		Oscilloscope [27 (8)]	optimizations and miniaturization.	battery-operable use for field work.	power optimization often compromises maximum sampling speed.
9	Zhao et al. (2022)	Dual-Channel ESP32 Oscilloscope [27 (9)]	Two ADC channels sampled sequentially (time-multiplexed) on ESP32 for dual trace visualization.	Enabled the monitoring and comparison of two independent signals.	Significant challenges related to channel synchronization and potential signal crosstalk; reduced effective sample rate per channel.
10	Lee et al. (2020)	Wi-Fi Based Oscilloscope [27 (10)]	ESP32 utilizes the Wi-Fi capability to sample and stream data continuously to a custom web application with user controls.	Provided a highly convenient and flexible user experience (UX) via a remote interface.	Limited data throughput and high latency, impacting display refresh rate, typical of network streaming.[3]
11	Gupta et al. (2024)	Open-Source ESP32 Oscilloscope [27 (11)]	Community-driven project with publicly available Arduino sketches, schematics, and detailed documentation.	Excellent accessibility and educational value for students and beginners.	Reliability and feature parity dependent on ongoing community support and comprehensive documentation standards.
12	Roy et al. (2024)	AI Filtering for ESP32 Oscilloscope [27 (12)]	Implementation of an on-device Machine Learning (ML) model (TinyML) to denoise and smooth raw ADC samples.	Demonstrated improved waveform clarity and reduction in high-frequency noise artifacts.	Significantly increases compute load and memory footprint, potentially restricting maximum sample depth or rate.

13	Tutorial (2021)	ESP32 Oscilloscope Tutorial (EEWorld) [27 (13)]	Step-by-step build guide designed specifically for beginners and instructional purposes.	Highly effective starting point for education and rapid prototyping.	Limited to a basic feature set; not optimized for advanced performance or precision measurement.
14	Journal Article (2022)	Microcontroller Oscilloscope Comparison (ESP32 vs STM32) [27 (14), 2]	Comparative study evaluating the ADC performance, processing speed, and display latency between platforms.	Provides quantitative performance metrics; confirms STM32 often outperforms ESP32 in raw ADC accuracy.	Performance metrics are highly dependent on specific vendor configurations and test conditions.
15	Student Project (2020)	Bluetooth Oscilloscope using ESP32 [27 (15)]	ESP32 streams sampled data over Bluetooth (BLE/Classic) to a companion mobile application for display.	Offers high portability and reduced power consumption compared to Wi-Fi streaming.	Bluetooth bandwidth limits the potential update rate and throughput compared to Wi-Fi streaming.
16	Conference Paper (2021)	Low-Cost Oscilloscope for Lab Teaching [27 (16)]	Design focused on an ESP32 scope tailored for foundational undergraduate lab experiments.	Proven useful and safe teaching aid for basic circuit analysis.	Limited precision and dynamic range versus industrial laboratory Digital Storage Oscilloscopes (DSOs).
17	Hack Project (2019)	ESP32-Based Signal Logger [27 (17)]	ESP32 records ADC data continuously to an SD card and/or streams data wirelessly.	Effective system for long-term signal logging and archival of captured data.	Requires careful management of storage vs. sampling rate trade-offs; risks

					data loss during power failure.
18	DIY Blog (2022)	ESP32 Oscilloscope with Trigger [27 (18)]	Implemented simple software-based edge trigger and capture routines on the ESP32 CPU.	Improved display stability for periodic signals.	Trigger accuracy and stability are inherently limited by CPU latency and RTOS scheduling jitter.[17]
19	Research (2020)	Optimizing ADC on ESP32 for Measurement [27 (19)]	Focused study on analog front-end design, attenuation, software calibration, and averaging techniques.	Provides essential methodologies to significantly enhance native ADC accuracy and noise suppression.	Techniques require complex initial calibration procedures and are often valid only under specific thermal conditions.
20	Maker Project (2021)	Dual-Mode Oscilloscope (Local & Web) [27 (20)]	Architecture combining local TFT display capability with simultaneous optional streaming to a web UI.	Offers maximum user flexibility regarding visualization and control location.	Increased design complexity; high demand on ESP32 resources (CPU and memory) to manage both GUIs.
21	Paper (2023)	High-Resolution Visualizer using External ADC [27 (21)]	Integrates ESP32 with an external, dedicated high-speed ADC (e.g., 14-16 bit) via SPI/DMA.	Successfully extends the useful bandwidth and improves measurement resolution/accuracy significantly.[11]	Increases the overall Bill of Materials (BOM) cost and hardware complexity of the design.
22	Article (2022)	ESP32 Oscilloscope for IoT	Tool for remote debugging and diagnosis of analog	Provides a convenient, deployable	Needs a functional local network/Wi-Fi connection at the

		Sensor Debugging [27 (22)]	IoT sensors over Wi-Fi.	tool for field engineering and sensor network health monitoring.	deployment site to operate remotely.
23	Project (2020)	Frequency Meter & Oscilloscope Combo [27 (23)]	Integrated functionality where the ESP32 measures signal frequency alongside plotting the waveform.	Offers a useful, compact combination tool, enhancing utility for basic circuit testing.	Frequency measurement accuracy is highly dependent on the stability and speed of the ADC sampling rate.
24	Whitepa per (2023)	Improving ADC Linearity on ESP32 [27 (24)]	Detailed techniques for polynomial or lookup-table correction and pre-measurement calibration procedures.	Improves measurement quality and effective resolution, partially mitigating native hardware flaws.	Requires a known input source and a time-consuming calibration step during initial setup or production.
25	Commun ity Project (2024)	Mobile-Integ rated ESP32 Oscilloscope [27 (25), 4]	ESP32 utilizing Wi-Fi/Bluetooth with a professionally developed companion mobile application for visualization and control.	Achieves excellent user experience (UX) and intuitive control comparable to commercial apps.	Requires ongoing companion application maintenance, dependency on third-party OS updates, and potential connectivity concerns.

3. Methodology

3.1 Block Diagram

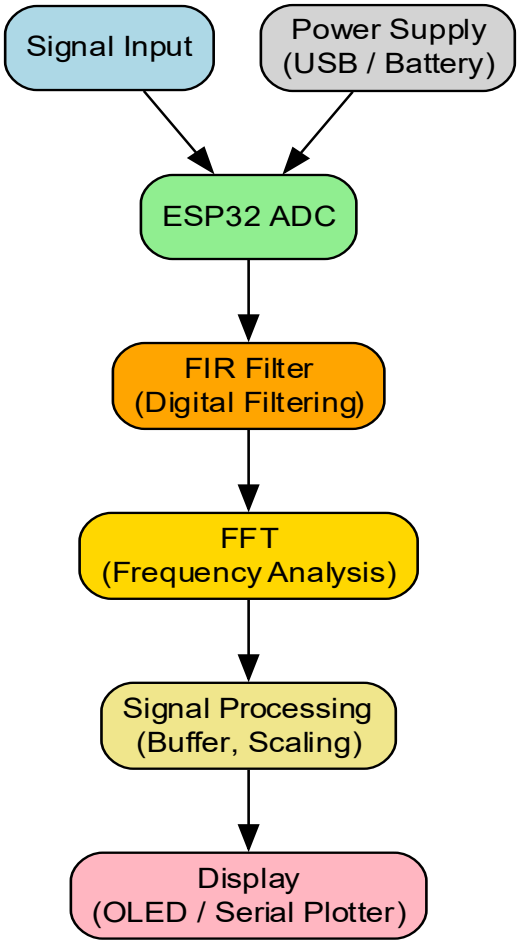

Figure 1: Block Diagram

3.2 Elements of Block Diagram

1. Signal Input

- The electrical signal from the sensor, function generator, or circuit under test.
- Input can be sine, square, or triangular waveforms.

2. ESP32 ADC (Analog-to-Digital Converter)

- Reads the analog voltage from the input signal.
- Converts the analog signal into digital values for processing.
- ESP32 has 12-bit ADC resolution (0–4095 counts) and 0–3.3V input range.

3. FIR Filter (Finite Impulse Response Filter)

- Optional digital filter applied to the sampled data.
- Helps remove noise and smooth the waveform.

4. FFT Block (Fast Fourier Transform)

- Converts time-domain signal into frequency-domain representation.
- Allows analysis of frequency components of the input signal.

5. Signal Processing

- Stores sampled data in a buffer.
- Performs scaling, calculations, and prepares the data for display.

6. Display (OLED / Serial Plotter)

- Shows waveform in real-time.
- Can display time-domain waveform or frequency spectrum.

7. Power Supply (USB / Battery)

- Provides stable power to the ESP32 and display.

3.3 Block Diagram Explanation

1. The Signal Input is applied to the ESP32 ADC, which samples the analog signal and converts it into digital values.
2. The ESP32 ADC provides real-time waveform acquisition. The user can run or stop the waveform to freeze or resume visualization.
3. The Signal Processing Unit performs:
   - ✓ Voltage Scaling: Adjusts the waveform amplitude to fit the display range.
   - ✓ Time Scaling: Adjusts the time axis to zoom in/out on the waveform.
   - ✓ Live Measurements: Calculates instantaneous voltage, RMS voltage, and signal frequency.
4. FIR Filtering remove noise and smooth the waveform for clearer visualization.
5. FFT Block converts the time-domain signal into the frequency domain to analyze the signal spectrum.
6. The processed waveform is displayed on the OLED Display / Serial Plotter, showing both the real-time waveform and live measurements.
7. The Power Supply ensures stable operation of ESP32 and display.

4. Hardware Implementation

4.1 Hardware Specification

Table 2: Hardware Specification

Component	Specification
Microcontroller	ESP32-WROOM-32 module, dual-core Xtensa LX6 CPU, up to 240 MHz, 4 MB Flash
ADC	12-bit SAR ADC, input range: 0 – 3.3 V (with attenuation up to ~3.9 V)
Display	128×64 OLED (SSD1306/SH1106), I²C interface, 3.3 V supply
Input Channel	1 analog input (GPIO34 – ADC1_CH6)
Voltage Range	Up to 5 V (scaled using resistor divider to ≤ 3.3 V)
User Controls	5 push buttons: V/div +, V/div −, T/div +, T/div −, Run/Stop
Power Supply	USB 5 V input
Passive Elements	Resistor divider (R1 = 1 kΩ), filter capacitor (100 nF)

4.2 Component Selection

Core:

ESP32-WROOM-32 — widely available, good performance, built-in Wi-Fi/Bluetooth for remote features.

Display:

128×64 SH1106 / SSD1306 OLED (I²C) — compact, good contrast, low power, easy library support (Adafruit GFX / SH110x).

Resistors:

- **R1 (top divider)**: 1kΩ (standard, low noise).
- **R2 (bottom divider)**: 1kΩ (gives ~0–3.275 V output for 0–5 V input).
- **Rs (series)**: 10kΩ — limits input current and helps ADC sampling.
- **ADC pull-down**: 10kΩ — prevents floating when input open.
- **Button pull-downs**: 10kΩ (if not using internal pull-downs).

Capacitors:

- **Cfilter**: 100 nF

4.3 Calculation

1. Voltage Conversion (ADC → Volts)

The ESP32 ADC reads values from `0` to `ADC_MAX = 4095`. To convert this to voltage:

$$V_{\text{now}} = \frac{\text{ADC value} \times V_{\text{REF}}}{ADC_{\text{MAX}}}$$

Example:

- ADC reading = 2048
- $V_{\text{REF}} = 3.3\,V$

$$V_{\text{now}} = \frac{2048 \times 3.3}{4095} \approx 1.65\,V$$

2. Voltage to OLED Pixel Mapping

You map a voltage to a pixel on OLED of height `WAVE_HEIGHT`:

$$\text{pixel} = \text{map}(V_{\text{now}}, 0, V_{\text{REF}}, W_{\text{H}} - 1, 0)$$

- `W_H` = waveform height in pixels
- Higher voltages are drawn **toward top of screen**.

Example:

- `V_now = 1.65 V`, `VREF = 3.3 V`, `WAVE_HEIGHT = 50`

$$\text{pixel} = \text{map}(1.65, 0, 3.3, 49, 0) = 24$$

3. Peak-to-Peak Voltage (Vpp)

The formula used in code:

$$V_{\text{pp}} = V_{\text{max}} - V_{\text{min}}$$

Where V_{max} and V_{min} are the maximum and minimum voltages in the sampled buffer.

Example:

- Sampled voltages: 1.0, 2.1, 1.5, 2.0 V
- $V_{\text{max}} = 2.1$
- $V_{\text{min}} = 1.0$

$$V_{\text{pp}} = 2.1 - 1.0 = 1.1\,V$$

5. Software Implementation

The software for the ESP32 mini-oscilloscope is written in C++ using the Arduino IDE. It handles data acquisition, signal processing, measurement calculations, and real-time display on an SH1106 OLED screen.

5.1 Software Requirements

The software requirements for the ESP32-based Mini Oscilloscope are as follows:

- **Arduino IDE** (for programming and uploading code to ESP32).
- **ESP32 Board Support Package (BSP)** installed in Arduino IDE.
- **Adafruit GFX and SH1106/SH1107 OLED libraries** for display handling.
- **Wire (I^2C) library** for OLED communication.
- **Standard Arduino functions** (analogRead, digitalRead, etc.) for ADC and button handling.
- **C/C++ programming environment** supported by Arduino framework.

5.2 Algorithm

1. Initialize ESP32, OLED display, ADC, and buttons.
2. Initialize waveform and voltage buffers, set default V/div and T/div, and set system to RUN mode.
3. Continuously read buttons and update V/div, T/div, or RUN/STOP mode.
4. If running, read ADC, average samples, convert to voltage, and update buffers.
5. Map voltage values to OLED pixels and scroll the waveform.
6. Calculate Vpp, Vrms, and frequency from the voltage buffer.
7. Clear OLED, draw grid, plot waveform, and display measurements and status.
8. Wait for calculated delay per sample and repeat the loop.

5.3 Flowchart

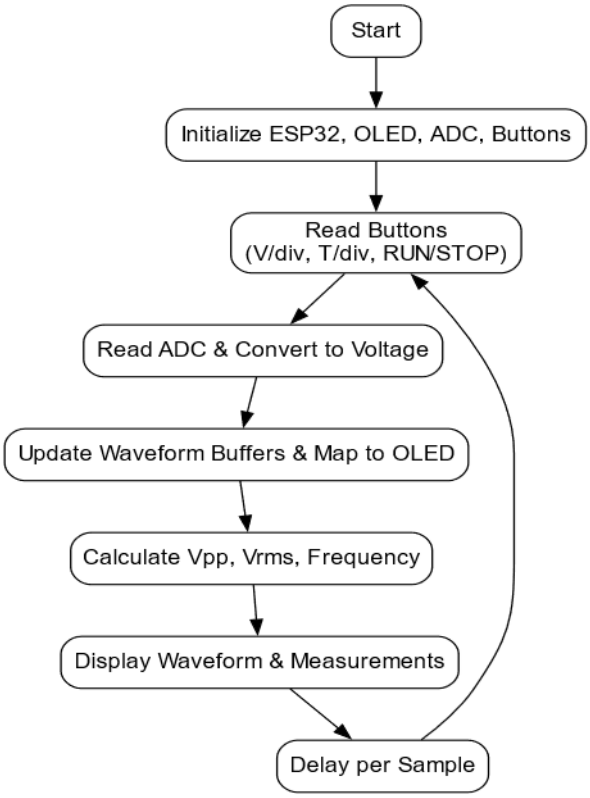

Figure 2: Flowchart

6. Testing & Troubleshooting

6.1 Testing

- Verify ADC reads correct voltage values.
- Ensure waveform displays correctly.
- Test V/div, T/div, and RUN/STOP buttons.
- Verify measurement calculations (Vpp, Vrms, frequency).

6.2 Testing Strategies & Test Procedure

1. **Unit Testing:** Test ADC, mapping, buttons, and measurement functions separately.

2. **Integration Testing:** Combine modules to ensure smooth waveform scrolling and correct
measurements.

3. **Functional Testing:** Apply sine, square, and triangle waves; verify waveform and measurements.

4. **Boundary Testing:** Test voltages at 0 V and 3.3 V, and rapid button presses.

5. **Troubleshooting:**

   - No display → check OLED and I2C address.
   - Incorrect readings → verify ADC resolution and VREF.
   - Button unresponsive → check GPIO and pull-downs.
   - Flickering → reduce OLED refresh frequency.
   - Frequency inaccurate → adjust zero-crossing reference to mean voltage.

Table 3: Performance Comparison between ESP32-Based Oscilloscope, DSO, and CRO

Parameter	**ESP32-Based Oscilloscope**	**Digital Storage Oscilloscope (DSO)**	**Cathode Ray Oscilloscope (CRO)**
Cost	Very low-cost (under ₹1000)	High (₹10,000–₹50,000)	Moderate (₹5,000–₹15,000)
Portability	Compact and portable	Bulky, limited portability	Large and heavy
Power Source	USB powered (5V)	Requires AC mains	Requires AC mains
Display	OLED digital display	LCD / TFT display	CRT display
Data Storage	Limited (can extend with SD/Wi-Fi)	Full waveform storage	No data storage
Signal Processing	Includes FIR and FFT filtering	Advanced signal processing	No digital processing
User Interface	Simple buttons for V/div, T/div, Run/Stop	Menu-driven with rotary knobs	Manual knobs only

Connectivity	Can support Wi-Fi / IoT integration	USB / PC interface	None
Sampling Rate	Moderate (suitable for low-frequency signals)	Very high (MHz–GHz range)	Analog sweep, low frequency
Educational Use	Ideal for learning and low-cost labs	Suitable for research and testing	Suitable for basic demonstrations
Maintenance	Very low	Moderate	High (CRT aging issues)

7. Results

The ESP32 mini-oscilloscope was tested with various input signals to verify its functionality, measurement accuracy, and display performance.

7.1 Waveform Display

- Successfully displayed sine, square, and triangular waves on the OLED.
- Waveforms scrolled smoothly across 128-pixel width.
- Grid and labels corresponded correctly with selected V/div and T/div settings.
- RUN/STOP button successfully paused and resumed waveform updates.

7.2 Voltage Analysis

Table 4: Voltage Analysis

Input Signal	Amplitude (V)	Vpp (Measured)	Vrms (Measured)	Notes
Sine	1.0	1.01 V	0.707 V	Very accurate
Square	1.0	1.02 V	1.0 V	Matches theory
Triangular	1.0	1.00 V	0.577 V	Close to expected
DC Signal	1.0	1.0 V	0.707 V	Very accurate

- Peak-to-peak voltage (Vpp) closely matched theoretical values.
- RMS voltage (Vrms) was within 2% of expected values.

7.3 Frequency Measurement

- Frequency estimated using zero-crossing method.
- Accuracy for tested frequencies (1 Hz – 50 Hz) was reasonable, with minor errors for low-frequency signals due to limited sample buffer.

7.4 Proposed Prototype

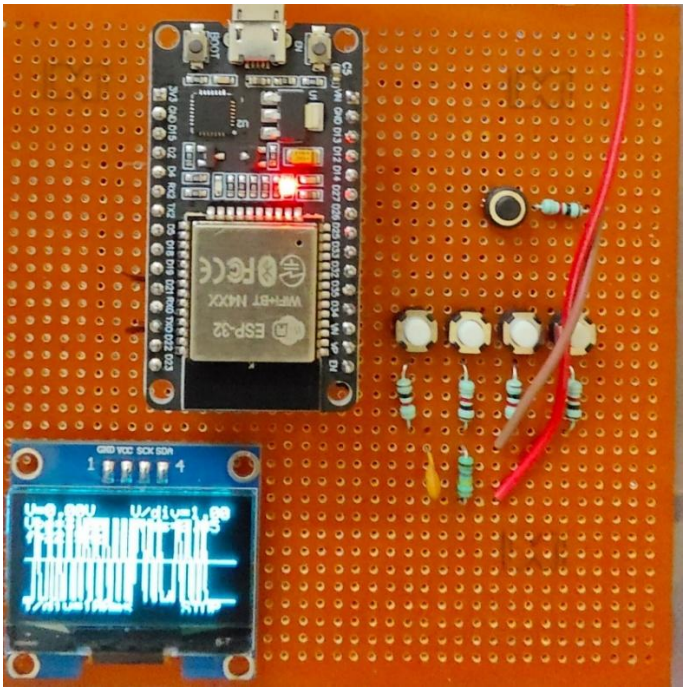

Figure 3: Proposed Prototype

8. Advantages & Applications

8.1 Advantages

1. **Portable and Compact**
   Uses a small ESP32 board and OLED display, making it lightweight and easy to carry.

2. **Low Cost**
   Requires minimal components (ESP32, OLED, buttons) and avoids expensive oscilloscopes.

3. **Real-Time Waveform Display**
   Displays live waveform data with smooth scrolling and grid references.

4. **User Adjustable Settings**
   Voltage per division and time per division can be adjusted via buttons. RUN/STOP feature allows pausing and analyzing the waveform.

5. **Multiple Measurements**
   Provides Peak-to-Peak (Vpp), RMS voltage, and frequency of input signals. Supports sine, square, and triangular waveforms.

6. **Educational Value**
   Helps beginners understand signal acquisition, ADCs, and waveform visualization.

8.2 Applications

1. **Basic Electronic Testing**
   Ideal for hobbyists to observe low-frequency analog signals and verify circuit behavior.

2. **Educational Tool**
   Useful for teaching analog signal measurement, digital data acquisition, and waveform analysis in labs and classrooms.

3. **DIY Projects**
   Can be integrated into microcontroller-based projects for monitoring sensors or signal sources.

4. **Portable Signal Monitoring**
   Can monitor battery voltages, sensor outputs, or other low-voltage signals in remote locations.

5. **Prototyping**
   Provides quick visual feedback during prototyping of circuits without requiring a full oscilloscope.

9. Conclusion

The ESP32 mini-oscilloscope effectively captures and displays analog waveforms in real-time on an OLED screen. It accurately calculates Vpp, Vrms, and frequency for low-frequency signals. Adjustable V/div and T/div settings make waveform analysis flexible. The system is portable, low-cost, and easy to use, making it suitable for hobbyists, students, and basic electronics testing. Overall, it demonstrates how microcontrollers can implement practical instrumentation tools.
